*DeltAg Product Brief*  
March 4, 2014

# **HARSH WINTER**

## **Help Wheat Health Now!**

*Sulfur Plus*      **For Nutrient Efficiency**

*PercPlus*      **Keep Crop Development on Track**

### **Liquid Nitrogen & DeltAg Sulfur Plus:**

Late winter and early spring application of liquid nitrogen, while a good practice for nitrogen efficiency, can and has been observed at times to create leaf burn to tender young wheat. This damage, while temporary, can cause a set back or delay in crop development. Also, on cold and/or wet soils, sulfur availability can be hampered causing nitrogen to work less efficiently. That being said, *Sulfur Plus* from *DeltAg* is designed to help the crop to better respond to the organic or residual sulfur that is in our soils. The addition of *Sulfur Plus* at 32 ounces per acre to liquid nitrogen applications over wheat, has been observed by many growers appearing to help reduce the risk of foliar burn from liquid nitrogen. Remember, one quart of *Sulfur Plus* is only 1/4<sup>th</sup> pound of actual Sulfur so “*It’s not what you put out, but what gets in the plant...that counts!*”

### **Stressed Wheat: Apply PercPlus as Wheat Comes Out of Dormancy & Begins to Grow:**

At *DeltAg*, we highly recommend a foliar application of *PercPlus* at 24 ounces per acre to help get the wheat crop growing and developing as quickly as possible following these bitter-cold water-logged conditions. *PercPlus* is applied with many different pesticides but always check for compatibility before any large scale tank-mixing.

### **Healthy-Active Roots Equals Healthy Plants and Higher Yields:**

Healthy vigor is critical in determining overall crop potential when wheat fields first come out of dormancy. Stress from bitter-cold and water-soaked soils will, no doubt, impact early root activity, growth and tillering. Water-logged soil means less oxygen, poor aeration, reduced root activity, less nutrient uptake, poor tillering and slow growth.

**Help Your Wheat Crop** by taking action now to aid crop recovery from a very stressful winter. The two practices above have consistently resulted in healthier, more productive wheat from many growers in many wheat growing areas.
