## Add PercPlus to Overhead Herbicides

**What do seedling crops need for normal development?**

- 1. Improved Roots:** Uptake of moisture and much needed nutrients.
- 2. Increased Vigor:** Early growth equates to a healthier plant life cycle.
- 3. Reduced Stress:** Seedling tolerance to stress reduces delays in development.

When we reduce or avoid stress from environmental factors or herbicide applications, the crop will continue to develop on track, resulting in a timelier and more complete crop set.

Overhead herbicide applications under many circumstances can cause undue stress to seedling crops. Growers across the South and Midwest have experienced reduced issues with herbicide stress when tank-mixing *PercPlus* with glyphosate and other herbicides. Satisfy yourself and give it a try!

**NOTE:** *PercPlus* is normally applied with herbicides, insecticides or fungicides.  
Always check for compatibility before any large-scale mixing.

### **Guidelines for Seedling Applications of *PercPlus* with Overhead Herbicides**

1. When **ONE** trip is planned: Apply 24-32 Oz *PercPlus*.
2. When **TWO** trips are planned: Apply 12-16 Oz *PercPlus* in each application.  
**NOTE:** If the two trips are separated by more than three weeks, apply 24 Oz/acre with each.
3. If your only interest is to reduce crop impact of herbicides, apply 10-12 Oz *PercPlus* per trip.
