Boost Wheat Potential With a Great Start!

DeltAg Product Brief

Oct 3, 2011

DeltAg Seed Coat:

DeltAg Seed Coat is a very fine powder that is applied to seed the day you plant the crop. It is designed to be kept dry in the application. Simply stir it into the seed in the seed bag or hopper on the planter. Four ounces will treat a 50 pound bag of most seed sizes. For farmers, it can replace their required TALC/GRAPHITE. This dry powdered product is very effective in sticking to the seed. It has been tested in aerial applications at 180 MPH with great success.

***DeltAg Seed Coat* is not a replacement for an inoculant.**

How Seed Coat Works: All seed expend energy to sprout and push out of the ground and then they go through what we refer to as a **lag phase** where they basically rest and regroup. **Seed Coat** is designed to help the seed through that phase quicker. The less stress, the shorter the lag phase and the less time there is for other conditions like moisture, disease or chemical damage to set the seedling back even further. The concept is to get it out of the ground and growing as quickly as possible to avoid those stress conditions.

In reality, if there is no stress and all conditions are good, the **Seed Coat** will show very little results. In other words, Mother Nature is at her best and the seed needs very little, if any help. Unfortunately, we rarely see these ideal conditions. Farmers soil test and apply lime and fertilizer, buy the best seed available, prepare their ground and then plant when conditions are right. After planting, a packing rain comes or winds dry out the soil too quickly and the result is suffering seedlings. Hence, the need for **DeltAg Seed Coat**.

Apply **DeltAg Seed Coat** when planting **ANY SEED!**

DeltAg PercPlus and Fall Tillering:

Proper tillering is the next phase of crop development that poses a threat to final yield potential. Many growers have found that a follow up application of **PercPlus** at 24 ounces per acre broadcast at first tillering will enhance the wheat crop's ability to continue to tiller at a healthy rate. We all know that more tillers equals more yield, but we at **DeltAg** believe more natural tillering due to good vigor will be very beneficial to final yield. **PercPlus** is formulated with crucial phosphate, sulfate, zinc and copper for proper crop development.

Start your wheat crop with *Seed Coat* at planting and follow with foliar *PercPlus* and establish good yield potential in the Fall. No catch up in the Spring!
