Soybean Overhead Herbicides Causing Crop Delays

Reduce Burn & Stress

**Add 16 Oz *PercPlus* to
Herbicide**

We all know weed control is an absolute MUST. While there are options as to the method, we all know those options appear to be fewer and fewer. To make overhead foliar applications of harsh herbicides that obviously damage or burn the crop foliage is becoming the norm in many areas. While this practice may be absolutely necessary, to accept that damage to the crop is a part of this practice just is not true. At *DeltAg*, we have many growers that are taking two different approaches to this concern by the use of *PercPlus*.

1. If the crop is healthy, they are simply tank-mixing 16 Oz of *PercPlus* in with the herbicide to help reduce or avoid this typical foliar burn.
2. If the crop is already in stress from some other factor, we see growers making an application of *PercPlus* in advance of the overhead herbicide treatment in order to build more crop tolerance to this herbicide.

Don't allow your weed control program to set your already late crop back even further. Apply *PercPlus*!
